Date: 17/9/2026, 2:42:42 pm
Evaluated: 2026-09-17T14:42:36.834923+05:30

Total Score: 95 / 100

Algorithm: 35 / 40 marks
Code: 40 / 40 marks
Output: 20 / 20 marks

Algorithm Feedback

The algorithm outlines the basic steps to create the parent and child classes and instantiate the child. It captures the core idea of single level inheritance, though it could be expanded to mention method inheritance or overriding for completeness.

Code Feedback

The Java code correctly implements single level inheritance, with the Dog class extending Animal and inheriting its fields and methods. The main method demonstrates the inheritance by accessing inherited members and invoking both inherited and child class methods.

Output Feedback

The program runs successfully and produces the expected output, confirming that the inheritance relationship works as intended.

Strengths

• Clear demonstration of inheritance with a parent and child class
• Proper use of access to inherited fields and methods
• Correct and functional Java syntax that compiles and runs

Areas to Improve

• Expand the algorithm to include more detailed steps or mention method inheritance
• Consider adding an overridden method in Dog to illustrate polymorphism
• Include comments or documentation to explain the purpose of each class and method
